# IBM INNOVATION + OPEN BUSINESS INNOVATION

Bring **INNOVATION**  
to Italian market to  
tackle complex real-  
world industrial  
problems in the  
areas of human  
**well being**

Act as a catalyzer to  
capture **OPEN INNOVATION  
& NETWORK**: fostering  
partnerships and joint  
collaborations with the  
University & Research  
Ecosystem in Italy and  
innovative companies in key  
strategic world areas: US,  
Switzerland China, Israel  
and Japan

R&d

**Autonomous  
behaviors for  
machines will be  
a frequent asked  
option.**

# Active Intelligence

Individualized options or offerings on a universal scale becomes feasible. AI, big data and IoT enable content and experiences to be proactively tailored to the user with an unprecedented level of relevance along the whole industrial chains

Big Data

Decision Lakes

## Sense & Organize Data & Information

- Internet
- Web/Mobile
- Data
- Cloud / IoT

## Propose decisions for us and our businesses

- Analytics
- Artificial Intelligence / Machine Learning
- Natural Interfaces
- Multimodal Reasoning

## Product & Services that *Proactively* mediate users

- Behavior analysis to support Healthy decisions and Well being
- Augment Problem Solving and learning
- Active Cyber-Physical Systems (Homes, Bikes, etc.)
- Resilient Work Environments & Manufacturing

**Active support  
for aging and  
fragile  
population  
segment**

Senza

**New ways  
for learning  
and  
problem  
solving**

**Ambient and  
Human Interaction  
Automation  
& R&D - Discovery**

# Dementia in Italy

## 1.2 million in Italy

Today there are 47.5 million people in the world suffering from dementia and 8.2 million in Europe

## 37.7 Billion Euro expenditure (about 2% GDP)

Annual social cost in Italy (2015 data)

## 57%

Expected reduced ratio of the number of AD patients by a hypothetical intervention that delays the onset of AD by 5 years

## 45%

Diagnosis coverage in high income countries

Aiming to build a dataset and develop AI-powered analytics enabling to extract meaningful behavioral features from sensor data and infer changes in physical, cognitive, and mental functioning.

## Behavioral Data of IoT Sensors

Gait

Eye Movement

Phone Call

Voice Interaction

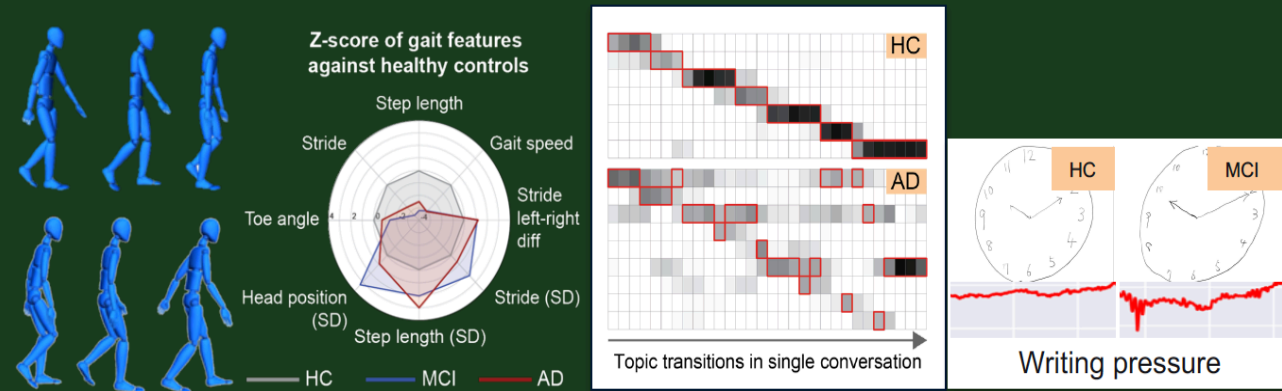

Preparing Meal

Drawing

## Behavioral Features

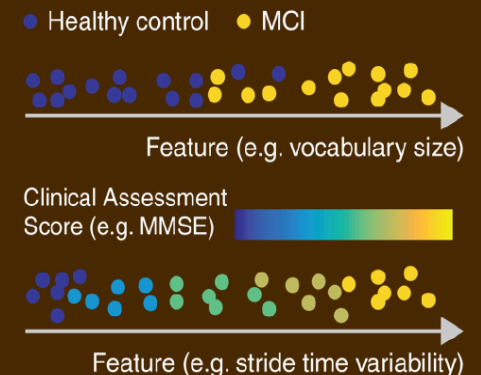

Extract changes in behavioral patterns as interpretable features

## Infer Clinical Outcomes

Bridge between behavioral changes and clinical outcomes

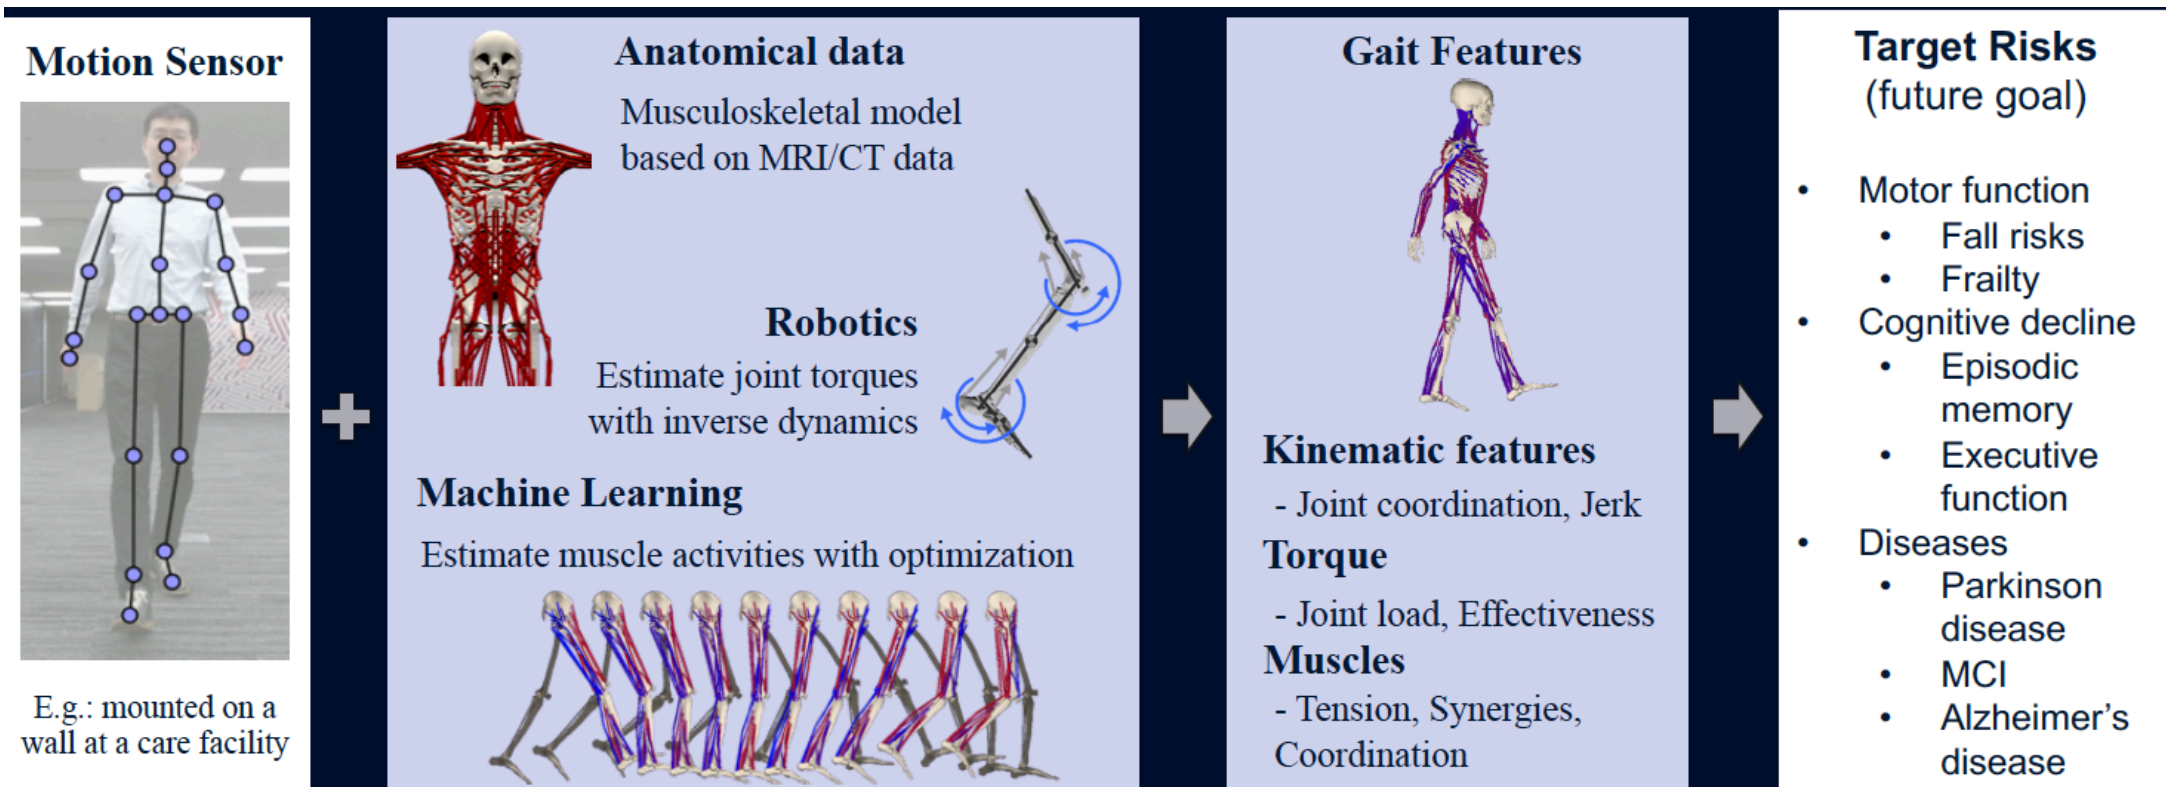

- ✓ Diagnosis (e.g. MCI, AD)
- ✓ Motor, Cognitive, and mental health functioning measured by clinical tests

# Gait Analysis

Estimate the whole body muscle and joint coordination from nonintrusive sensors which we can embed in our daily living environment, and enable accurate and early estimation of age related risks.

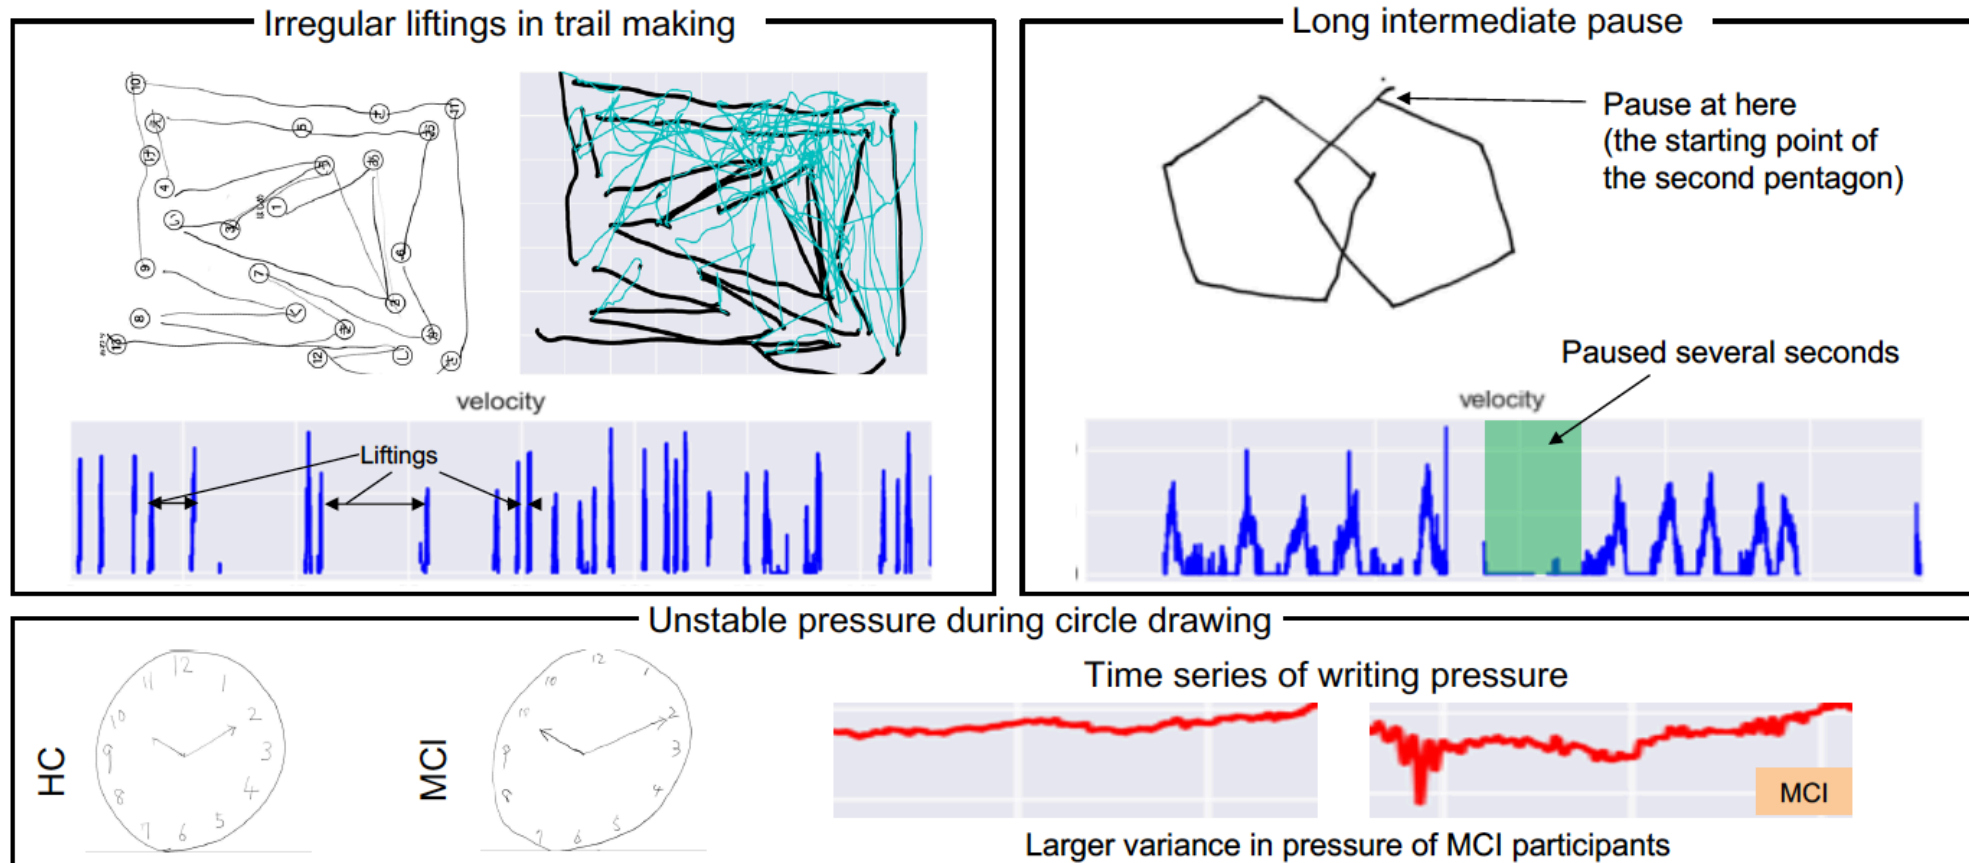

# Examples of Behavioral Features Related to Drawing

- Extracted features during tests and free text writing, and found significant difference among subjects' groups (HC/MCI/AD)
  - Features related to motor function: smoothness, writing pressure and its change
  - Features related to cognitive function: pause, order, and contents

[Garre-Olmo et al, Curr Alzheimer Res, 2017]

[Gulde et al, Front Neurol, 2018, Kahindo et al, IEEE, 2018]

[Ishikawa et al, MedInfo, 2019]

# Action recognition to estimate Activities of Daily Living (ADL) of elderly people with standard RGB cameras

--Top Actions:  
 0.328 -> dining  
 0.310 -> socializing  
 0.100 -> eating  
 0.052 -> giggling  
 0.015 -> smiling  
 0.012 -> discussing  
 0.012 -> serving  
 0.011 -> giving  
 0.011 -> cooking  
 0.009 -> celebrating  
 ...

UNIMORE  
 UNIVERSITÀ DEGLI STUDI DI  
 MODENA E REGGIO EMILIA

Gabrielli, et al. "Action recognition to estimate Activities of Daily Living (ADL) of elderly people" - FAAL 2019

Transfer Learning from Moments pretrained  
 Action predicted: eating at 87.6%

Predictions

Transfer Learning from ImageNet pretrained  
 Action predicted: eating at 76.2%

Predictions

NeuNetS model

Action predicted: eating at 87.0%

Predictions

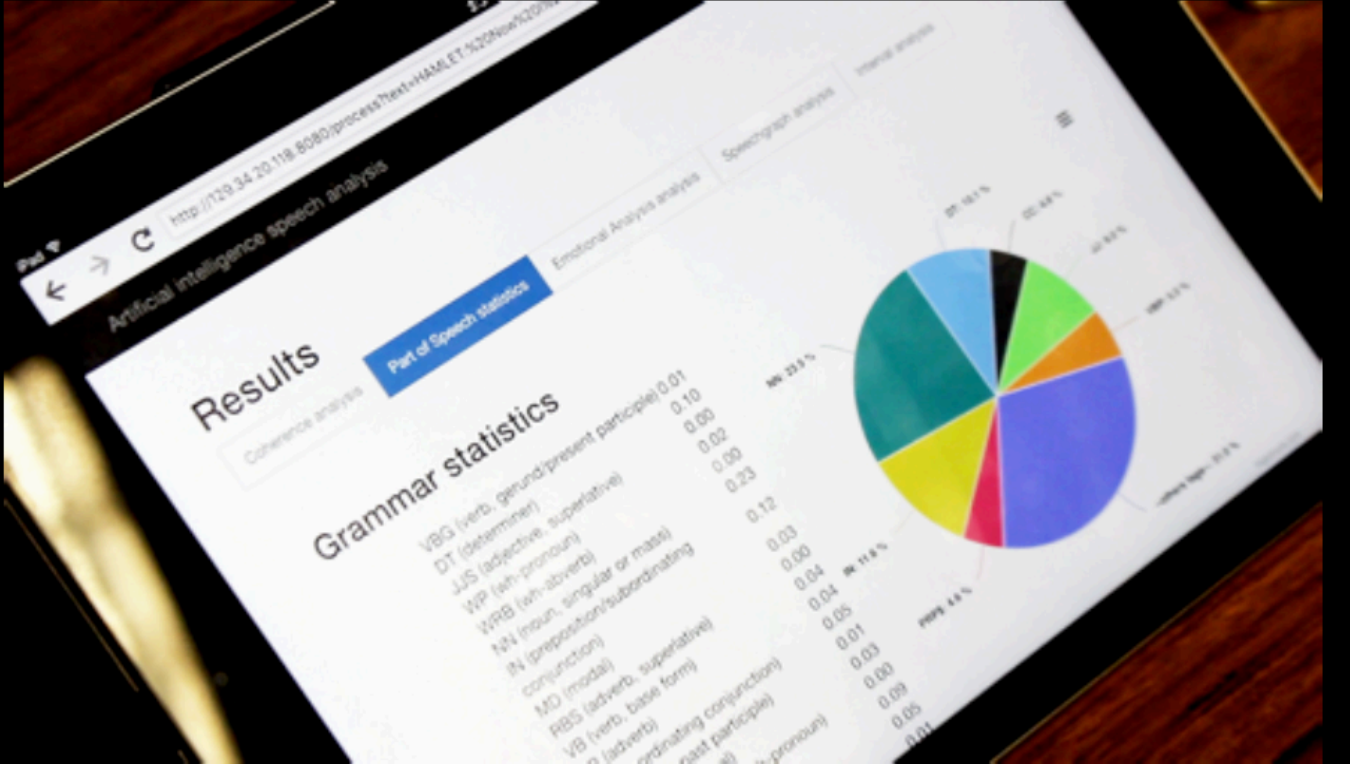

Based on our efforts about the relationship between speech and mental health, we're developing a realtime engine to help clinical decision making including timely diagnosis and intervention.

Depression, Bipolar disorder, Parkinson's disease, Schizophrenia, Dementia, Mild cognitive impairment, Emotion, Mood, Daily physical condition, etc.

# Virtual Trainer for cognitive impaired patients

**ViTA Advisor:** it is a conversational multi-modal agent to support older as well as a tool to collect meaningful data about the context of an individual

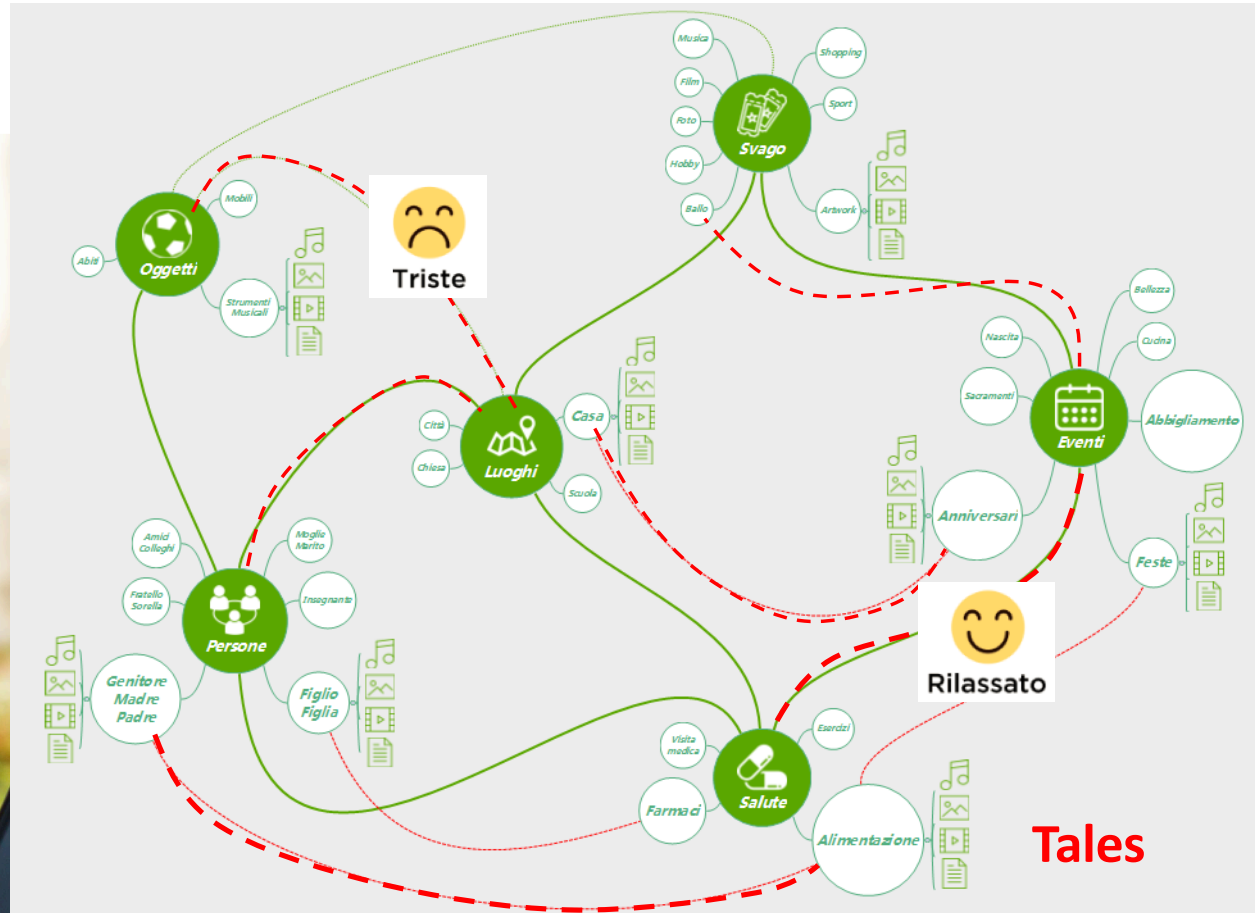

**Vita Memory Coach:** a system that supports caregivers to collect meaningful facts and memories of an individual and his context

**Sustain  
Independence and  
Dignity with affect  
and purpose,  
preserve and  
reinforce individuals  
and social memories**

# Coaching our memory and triggering affective states

# THANK YOU
